General Information

Account Center User Database Integration - What is it and how does it work?

User Database Integration (UDI) allows your company to integrate its HRIS employee data into LinkedIn applications. This data can then be used to authenticate and manage your employees' access to certain paid LinkedIn applications by your system administrators. The integration includes:

- **Employee Data:** Uploading employee data from your HRIS systems.
- **SSO:** Optionally configuring Single Sign-On with your SSO solution.

When using UDI, your employees can log into supported LinkedIn applications using a separate UDI identity tied to them as your employee rather than their personal LinkedIn accounts. This distinction allows your employees and your company to have more precise control over their respective data.

The integration is configured through the LinkedIn *Account Center* and is only available for some paid LinkedIn applications.

Which LinkedIn applications support UDI?

Currently, only LinkedIn Learning supports UDI, with support for more applications planned.

Can LinkedIn applications leveraging UDI access data from an employee's personal LinkedIn member account?

Yes, but only if the LinkedIn application supports UDI and the member has expressly permitted it.

UDI supports *binding* (or *linking*) a personal LinkedIn account to your employee's UDI identity. This allows the LinkedIn application and the employee to leverage his or her own personal data (such as their connections) in LinkedIn applications that support UDI.

How do I get access to Account Center?

Account Center has features for Enterprise customers in addition to support for UDI. Please contact your sales representative for more information.

Employee Data

What is the employee data in UDI used for?

The employee data is used to create an identity for the employee and to build an employee profile. The identity is used for a few purposes including:

- **Authentication:** Determines access for the LinkedIn products that you have purchased. When using SSO, it is used in conjunction with your SSO provider to authenticate users.
- **Usage Tracking:** This allows us to provide metrics on how your employees are using each LinkedIn application.

The employee profile is used for the following purposes.

- **Search:** Employee search provides a way to find employees. For example, this allows your company administrators to find employees to grant access rights.
- **Application Configuration:** LinkedIn applications can use profile data for configuration. For example, licenses to access application features can be assigned based on profile data.

What protocols do you support to upload employee data?

The employee data can be uploaded via the LinkedIn Account Center through a web-based user interface (collectively, with the below methods, the UDI interface). Additionally, the following protocols are supported for uploading UDI employee data.

- **SFTP:** Data is uploaded via SFTP to LinkedIn SFTP servers secured by public key infrastructure.
- **HTTPS:** Data is POST-ed to LinkedIn datacenters via HTTPS using an OAuth 2.0 access token.

Data is represented in a CSV format, and the file is encrypted in-transit and at-rest on the server during processing.

What employee data needs to be uploaded?

UDI supports uploading a variety of data about a company's employees. The minimal set of recommended fields are listed below:

Field	Description
Unique ID	A unique identifier (usually immutable) for the employee.

Primary Email Address	The primary email address to which communications will be sent.
First Name	The employee's preferred first name.
Last Name	The employee's preferred last name.

Do I need to upload data for all of the company employees?

No. You may upload data for a the part of your organization that uses LinkedIn applications. If you choose to upload data on all of your employees, however, you can then take advantage of full employee searches and license automation across your entire organization.

Single Sign-On (SSO)

Single Sign-On (SSO) - What is it and how does it work?

Enterprise Single Sign-On (SSO) allows your company's employees to sign into supported LinkedIn applications using their corporate credentials instead of their LinkedIn credentials.

Which LinkedIn applications support SSO?

Currently, LinkedIn Learning supports SSO, with support for more applications planned.

What protocols do you support for SSO?

We currently support SAML v2.

Is SSO required? What if I do not have an SSO solution for my company or do not want to use SSO?

No. Using SSO and integrating with an SSO provider is not required to use LinkedIn applications. If SSO is not configured, your employees may authenticate themselves using their current personal LinkedIn credentials or create a new member account.

Account Binding

What is Account Binding, and how is it used?

Account binding allows your employee to “bind” their personal LinkedIn account to their UDI employee account. Binding provides the following features.

- Access to personal member account data (such as public profile data or connections) from your employee’s UDI identity when using purchased LinkedIn applications.
- Employee retains the right and control to the binding based on their privacy concerns.
- A clear separation between personally owned data associated with the member account and company owned data associated with the UDI identity.
- Authentication to LinkedIn applications when not using SSO

How do I setup my account bindings?

Binding is setup when an employee first logs into a purchased LinkedIn application that supports UDI.

As part of the application onboarding flow, your employee may bind their personal LinkedIn account to their UDI identity.

Is binding required to use my purchased LinkedIn applications?

For the purchased LinkedIn applications that use UDI, binding is currently required. This requirement is determined by the individual LinkedIn applications and may change based on the application’s feature set.

When bound, what data is the company allowed to see on behalf of the employee?

During the binding process, the employee is presented with a list of permissions that enables the company to use the employee's personal LinkedIn account in certain ways. The employee is free to accept the binding or create a new account to bind. The goal of this process is to make it very clear to the employee how his or her personal data is used by the UDI identity and LinkedIn application. The exact list of permissions varies by application. Some examples of permissions include:

- **View Profile:** LinkedIn member profile data of the bound personal account is made available to the company via the LinkedIn application. As always, the data would follow the member's privacy settings.
- **View Connections:** The member's personal connections are accessible to the company via the LinkedIn application.

Only a few read permissions to a personal LinkedIn account are currently grantable. Write permissions to the personal LinkedIn account are not currently grantable and require would further authentication and authorization by the employee at the time of the write. All permissions are granted per application, and grants are not shared across applications.

What can an employee do if they have privacy concerns over the binding?

Users can unbind their personal LinkedIn accounts at any time by contacting customer service. When doing so, the data for that LinkedIn personal account from that point onwards is no longer available to the company and the LinkedIn applications the company has purchased. Additionally, customer service personnel can assist members in finding what UDI identity to which their LinkedIn personal account is currently bound.

What happens when an employee leaves the company?

If an employee leaves the company, it is up to the company to inform LinkedIn by uploading new employee data and removing old entries through the UDI interface. This can be done, for example, by uploading a CSV with the employee who has left marked as "inactive." If an employee is removed from all applications to which he or she has access, the employee's personal LinkedIn account is automatically unbound from their UDI identity and the company loses access to that employee's personal LinkedIn data.

In addition, at any time, the employee may choose to manually unbind their personal LinkedIn account from their UDI identity by contacting customer service.

Data Security, Privacy, and Confidentiality

Will other companies be able to access my company's data?

No. Other companies will not have access to your data that you uploaded.

Will my company have full access to my employees' personal LinkedIn accounts?

No. When logging in as an employee with a UDI identity, the user is logged in as that UDI identity, **not** as their personal LinkedIn account. As a result, your company has only restricted access to the employee's bound LinkedIn account, described in part below:

- No access to the employee's personal LinkedIn account data not explicitly granted by the employee (whether directly to the company or via the LinkedIn application).
- No access to unpaid sites, such as other content or functionality on www.linkedin.com, as the employee's bound LinkedIn account.
- No access to usage data when a member logs into a non-work related LinkedIn application with their personal LinkedIn account rather than their UDI identity.

For my employees with privacy concerns, what personal data is made available to my company when employees bind their LinkedIn accounts?

The employee is providing the company access to data only for the permissions they have explicitly granted during the binding step for the paid LinkedIn application. They may unbind at any time if any concerns arise. Any other data read or written to the employee's personal LinkedIn account, whether bound or not, must be explicitly approved and authenticated by the employee in-application. Once the unbinding takes place, the company may no longer use the granted permissions and access the granted data associated with that personal LinkedIn account.

What data uploaded through UDI can each of my employees access?

All employee data uploaded through UDI are visible to all UDI identities. Please do not add data to UDI that you do not want each user to see.

Can I control who can administer my UDI and paid LinkedIn application data?

Yes. UDI is configured only by the designated LinkedIn application administrators in your company. In addition, each application can manage its own set of administrators and roles based on their specific feature sets.

What can I do to make sure my data is purged from LinkedIn?

You can contact your customer support representative to ask for your company data to be purged.

Does LinkedIn have a SOC2 or SOC3 report available?

No. LinkedIn does not have a SOC2 or SOC3 report available at this time.

What is LinkedIn's privacy and data security policy?

<https://www.linkedin.com/legal/privacy-policy>

What security protocols/measures does LinkedIn use to protect customer data?

Our collection and use of member data and customer related data is governed by LinkedIn's privacy policy: <https://www.linkedin.com/legal/privacy-policy>.
